(www.autodesk.com) has released AutoCAD software for the first time ever as a mobile app! This new mobile version of AutoCAD, which we call AutoCAD LT, allows you to create architectural drawings and 3D models on your mobile device. Using AutoCAD LT, you can share your work instantly with colleagues and clients through Autodesk's cloud and mobile-first architecture. AutoCAD LT's most popular features include the ability to plan and manage your design projects at a glance, collaborate with colleagues and clients through the cloud, and review and discuss important design documents. These features are familiar to AutoCAD users and combine the best-in-class tools for creating architectural drawings with the mobility and flexibility of a mobile app. Accessing AutoCAD LT The easiest way to start creating a drawing is to open your AutoCAD LT application. Once you launch the app, the home screen displays. The first thing you should do is choose a template, the foundation for all your architectural drawings. From the home screen, you can click the apps icon in the top right corner of the screen to open the Apps panel. The Apps panel is a menu where you can access the entire suite of AutoCAD LT applications, as well as several companion apps for rendering and file management. In the Apps panel, you can also create new drawings from the templates, access existing drawings, or switch between the AutoCAD LT applications. To create a new drawing or access the templates, click the Apps icon in the top right corner of the screen. This article focuses on accessing the AutoCAD LT application itself. Figure A shows the Apps panel with the AutoCAD LT application selected. Figure B shows how to open the application. Figure A: The Apps panel with the AutoCAD LT application selected. AutoCAD VBA was introduced in Autodesk Architectural Desktop and Autodesk Structural Desktop on April 27, 2009 and in Autodesk Civil 3D in Autodesk Civil 3D on July 29, 2009. The capability for scripting using Visual Basic (VB) and Microsoft Visual Basic for Applications (VBA) became available in April 2009. AutoCAD 2007 added a set of VB and VBA based commands to support integrated design and documentation. AutoCAD Architecture in AutoCAD 2009 introduced the concept of an API based approach. As a result, Autodesk Architecture added numerous objects and functions that were not in Autodesk Architectural Desktop. In addition to using the aforementioned APIs, AutoCAD also supports a series of integrated applications based on their own in-house software development technologies, such as AutoCAD Architecture and AutoCAD MEP. APIs An API (application programming interface) is an interface or protocol that a software system exposes to computer programmers in order to facilitate the use of its functionality. AutoCAD provides many APIs, which are generally considered to be necessary for incorporating the software into a third party application. They are generally considered to be "application programming interfaces" (also referred to as "3rd party API"). These interfaces permit the third party application to control AutoCAD without the need to write any source code for it. Some third party software interfaces are open, meaning that a user can become an authorized developer of that software. This is not always the case, however. Generally, the third party API is secured with a license key. All AutoCAD interfaces are implemented in an ANSI standard C++ language, and comply with the AUTOCAD 2007 API specifications. Note: All APIs in AutoCAD 2011 are implemented in Visual Studio and can be compiled as unmanaged or managed code. The following are supported: AutoCAD Application Programming Interface (AutoCAD API): AutoCAD's API for programming with C++.
