Evaluation of a new serological method for the diagnosis of *Corynebacterium pseudotuberculosis* infection in sheep. A new serological method for the diagnosis of *Corynebacterium pseudotuberculosis* infection in sheep is presented. This method detects a 23 kDa O-specific polysaccharide from the bacterial cell-wall, which is highly antigenic and can be detected using a homologous antiserum in an enzyme-linked immunosorbent assay. The detection of specific antibodies was found to be specific for *C. pseudotuberculosis* infection, and the results correlated well with the number of live bacteria in the injection site of the animal.

Large-Scale Performance Measurement of Ionization Chambers for High-Energy Gamma-Ray Spectroscopy. In order to evaluate the performance of the large-scale high-energy gamma-ray spectrometer (HEGRIS) at the National Institute of Physics, Havana, Cuba, ionization chambers have been characterized in the 400-2500 ke
