Creating Layers (using the Layers palette) : This palette, shown in Figure 12-1, enables you to select a range of pixels in an image, move them, and organize them in a series of layers. Typically, you create a new layer by clicking and then pressing Enter on your keyboard (and then sometimes Ctrl+T). You can also manipulate a selection of pixels on an existing layer by clicking and holding the selection and dragging the pixels, or by clicking the Move tool, selecting a range of pixels, and then pressing the Delete key. (See the text box on Layers below for more information on layers.) To create and delete layers, you need to insert the Select tool and then click and hold down the Layers palette button. (A square with a light-blue diagonal line through it represents a selected pixel.) You can delete any layers by clicking the trash can icon, which appears in the Layers palette. When you start making layer selections, you see a screen that appears as shown in Figure 12-1, in which a selection frame surrounds an image. You can use the Select tool to create, delete, and manipulate your layers.

Manipulating Layers : As you create and move layers within an image, and as you add and delete layers, the original image is never changed. Instead, a new, separate layer appears to provide a new context for your changes. In the Layers palette (Figure 12-1), you see the various layers currently available in the image. To delete a layer, click its thumbnail and then press the Delete key. To create a new layer, click the Create a New Layer button and then click the layer's thumbnail. After you create a new layer, it takes on the name of the layer you first created.

Creating Smart Objects and other image corrections : Before you start making changes, consider whether you're going to be able to undo what you do. A common mistake is to use the Select tool to select a range of pixels in an image, as you might to add a new layer. In order to undo this selection later, you must create a Smart Object. Smart Objects, as the name implies, enable you to make changes that don't affect the original pixels of the image. There are several types of layers: a visible layer, a clipping mask (see the next section), and one or more hidden layers.

Cryosurgical treatment of onychomycosis. Cryosurgical treatment of onychomycosis has proven useful in a variety of clinical settings. The ability to freeze a number of tissues combined with the potential for repeat treatments may make it a particularly useful modality in this disorder. A questionnaire was mailed to Canadian clinicians to assess the application and results of cryosurgical treatment of onychomycosis, as well as to discover any potentially useful variations in technique. A response rate of 75% from 72 orthopaedists and other clinicians indicated that 34% of the respondents treated onychomycosis, and 78% of those who did not treat onychomycosis indicated that they planned to treat the condition in the future. The most common etiologic agent was *Fusarium* (67%), followed by *Trichophyton* (19%), *Candida* (15%), and *Geotrichum* (10%). The cost of the procedure and the usual requirement for two treatment sessions per affected digit appeared to be the main factors in declining application. Cryosurgical treatment of onychomycosis was considered a safe, effective, and simple method of treatment for toenails and fingernails. Reported success rates were high, and the response to treatment was favorable among most subjects who completed the questionnaire. However, the use of cryosurgery in onychomycosis appears to be declining, perhaps because of the reduced incidence of onychomycosis in general.
