A: You can use the following code: Dim All\_Dict As Object, i As Long  
Dim strFile As String, line As String Dim FSO As Object,  
Folder\_Name As String, file\_name As String, extension As String,  
ofile As String Dim j As Long, n As Long 'Create Object Dim All\_Dict  
As Object Set All\_Dict = CreateObject("Scripting.Dictionary") 'Open  
Folder Set FSO = CreateObject("Scripting.FileSystemObject")  
Folder\_Name = "D:\Scripts\File\_Checker" For j = 2 To  
MyListBox.ListCount - 1 file\_name = MyListBox.List(j) extension =  
LCase(ExtractFileExtension(file\_name)) If Not  
All\_Dict.Exists(extension) Then 'Get the size of the file n =  
Application.GetSaveAsFilename \_  
(InitialFileName:=ExtractFilePath(Folder\_Name), \_  
Filename:=file\_name, \_ Title:="Save As Type", \_  
DefaultFileName:="D:\Scripts\File\_Checker\Default.pdf") If n =  
False Then MsgBox "You have selected " & file\_name & " but it  
doesn't exist" End If Exit For End If ofile = Folder\_Name & "" &  
file\_name If FSO.FileExists(ofile) Then If FSO.FileExists(ofile &  
".pdf") Then 'Remove the other extension (.pdf) FSO.DeleteFile  
ofile, True End If d0c515b9f4

[For more on this, see StackOverflow post SO #16361048 (or ghar-chalta-hai.com for PORTUGUESE) Q: Dynamically generating codes from arrays I'm trying to find a way to create a dynamically generating class. I have an array with of stdClass Objects. Every object in the array has a title, a body, an id, and an image. I have written a function that returns a template code for the class: public static function getClass(\$title, \$body, \$id, \$image){ \$class = "class {\$title} {\$body} {\$id}"; \$class.= "image: url('{\$image}')"; return \$class; } I am using this template to generate all the code for a class. I have written a function for this too. private static function generateClass(\$title, \$body, \$id){ \$class = "class {\$title} {\$body} {\$id}"; \$class.= "image: url('{\$title}')"; \$class.= "image: url('{\$body}')"; return \$class; } I am then using the function to loop through all the classes to append them to the project: foreach(\$classes as \$class){ \$class = Static::getClass(\$title, \$body, \$id, \$image); \$template->setClass(\$class); \$template->setBody(addslashes(\$body)); \$template->setId(addslashes(\$id)); \$template->setTitle(addslashes(\$title)); \$template->setImage(addslashes(\$image)); \$html = \$template->toHtml(); echo \$html; } So far so good. The problem is, I want to be able to make it dynamic. I don't want to have to loop through the array of objects and do the above for every object. For example, I have a class "Product" that has title, description, price, and image. I want to be
