$$\left(\sum_{i=1}^n \frac{a_i^2}{\sqrt{\mu_i}} \right) \sqrt{\lambda} + \sqrt{\mu} \left(\sum_{i=1}^m \frac{b_i^2}{\sqrt{\lambda_i}} \right) \sqrt{\mu} = \left(\sum_{i=1}^n \frac{a_i^2}{\sqrt{\mu_i}} \right) \sqrt{\lambda} + \sqrt{\mu} \left(\sum_{i=1}^m \frac{b_i^2}{\sqrt{\lambda_i}} \right) \sqrt{\mu}$$
 The proof is similar to the proof of Proposition [main2]. [The $m=2$ case of Example [ex3] with $a_1 = 2$ and $a_2 = 4$] [data-label="fig1"] (m=2.pdf) {height="3.7cm"} Conclusion ===== In this paper, we have described three approaches to obtain approximations for the optimal objective function value of (1) in the general bilinear case. We have observed that in the bilinear case, for every fixed degree bound d , only a finite number of approximations are needed to approximate the optimal objective function value. On the other hand, the number of monomials involved in the representation of the optimal objective function value is exponential in d in the general bilinear case. To illustrate the tightness of the approximations for the objective function value, we have simulated both the linear and bilinear cases for $m = 2, 3, 4, 5$ and $\gamma = 2, 3$. We have seen that the target objective function values are approximated even for relatively small number of monomials and small number of constraints. However, the error in approximation rapidly decays as we increase the number of monomials or constraints. [00] Bertsekas, D. P.: Constrained optimization and Lagrange multiplier techniques.
