Layers: A key method of editing is through the use of layers. Layers are supported in all versions of Photoshop and Photoshop Elements. Layers work by allowing you to edit a single image by creating a new image above the existing one. The new image is its own layer, which can be overlaid with the original image. You can move, resize, blend, and blend with the new layer. Layers are a great tool for working with edits such as cropping, recoloring, and adding text. You can also stack layers to create multiple images. Moving objects: One of the most powerful features of Photoshop is its ability to handle multiple objects and manipulate them easily. You can move and scale an object on top of another. Creating patterns: Every element in Photoshop can be "textured," which means you can paint a background and have the texture "included" with your image. Pasting: You can also paste in any image from the host system. These images can be resized and repositioned on top of the original. Working with

Layers: Choosing a Layers Methodology Layers are a key method of image editing and manipulation, and the way you work with them is dependent on how many layers you have. The default setting is the many layers method of layer creation, but Photoshop has other methods as well. Many features, including correcting color and brightness, require only one layer. However, if you want to create realistic effects such as light and shade and work with masks, you will need more than one layer. The more layers you have in your image, the more complicated your work is and the longer the work takes to complete. Layers and Masking The more layers you have in a single image, the more complicated the image will be and the more challenging it will be to work with. This is because each layer adds new information. Each new layer becomes a separate bitmap. If you double the number of layers, you double the

number of bitmaps, but the file size stays the same. Each bitmap adds a file size and processing time. Each layer also affects the way the image is printed. More layers means that the image won't print as sharp, and the higher the number of layers, the more you can see on the final printed copy. The more layers you have, the longer it takes to complete the image and the higher the print quality will be. A

It is a kind of image format that allows the user to make changes easily in a smart way. The layers are organized in a simple, flexible and intuitive form. You can define, move, copy, cut or paste them into new layers, create new layers from existing layers and use masks (e.g. black rectangles) to exclude parts of the image to avoid changes in the specific area. Merge Layers Merging layers is the process of combining two layers into one. The combination of two layers has specific actions like scale, rotate and transform. An example for one of these actions is flip, where two layers are flipped over. Duplicate Layers Duplicate layers is a way to create identical copies of existing layers. It allows the user to use it to make changes in a copy without making them in the original image. You can create multiple copies and apply different actions to each one of them. There are basic brushes, normal brushes, gradient brushes and pattern brushes. Brushes can be used for various effects, including erasing, cleaning up an image, adding color, and painting. Brushes work by adding one or more color pixels to your image. You can also adjust the size of the brush and how much paint is added with the paint bucket. A paint bucket allows you to make changes to the paint color, size, and opacity of paint applied to your image. You can also control the blend mode. Blend modes are used to create various effects on your image. A lighten blend mode will lighten colors in your image, a darken mode will darken colors, and multiply or screen modes will multiply two colors. The Eraser tool works like a highlighter pen. When you use the Eraser tool as a brush, it changes to a darker color and larger brush. You can also use a ratio tool to erase an area. A ratio tool is used to set the size of the brush to the percentage of the image that you want to erase. A low value (less than 100%) means that the brush is smaller and the range is larger. A high value (over 100%) means that the brush is larger and the range is smaller. The Gradient tool allows you to create various colors on your image.
