The diagnosis and management of these lesions are not standardized. Case records were reviewed from a single orthopedic hospital for patients who had previously undergone arthroscopy for meniscal lesions. All had a meniscal cyst in association with either a meniscus tear or a meniscal cyst. All patients had magnetic resonance (MR) imaging, with and without fat-suppressed T2-weighted images. Cysts were defined as a fluid-filled structure anterior to the meniscus; they could appear adjacent to a meniscus tear or may be contained within the meniscus. In the surgical series, cysts were opened and fluid aspirated. Of the patients who underwent arthroscopy, one had a large meniscal cyst that extended from the meniscus to the lateral joint space. Proximal meniscal tears were removed in six patients; partial meniscectomy was performed in three patients. Meniscus lesions were repaired in all patients. Mean follow-up was 40 months
